1. Introduction

The purpose of this study is to investigate the effect of the use of a computer-based simulation on the learning of the concept of the area of a triangle. The study was conducted with a group of 30 students in a middle school. The students were divided into two groups: a control group and an experimental group. The control group used a traditional textbook, while the experimental group used a computer-based simulation. The results of the study showed that the experimental group had a significantly higher understanding of the concept of the area of a triangle than the control group. This suggests that the use of a computer-based simulation can be an effective tool for teaching this concept.

2. Method

The study was conducted using a quasi-experimental design. The participants were 30 middle school students, 15 in the control group and 15 in the experimental group. The control group used a traditional textbook, while the experimental group used a computer-based simulation. The data was collected through a pre-test and a post-test. The pre-test was administered before the intervention, and the post-test was administered after the intervention. The data was analyzed using a t-test to determine if there was a significant difference between the two groups.

3. Results

The results of the study showed that the experimental group had a significantly higher understanding of the concept of the area of a triangle than the control group. This was evident in the post-test scores, where the experimental group scored significantly higher than the control group. The t-test results showed a significant difference between the two groups, indicating that the use of a computer-based simulation had a positive effect on the learning of the concept of the area of a triangle.

4. Conclusion

The study concluded that the use of a computer-based simulation can be an effective tool for teaching the concept of the area of a triangle. The experimental group, which used the simulation, showed a significantly higher understanding of the concept than the control group, which used a traditional textbook. This suggests that the use of a computer-based simulation can be a valuable addition to the curriculum for teaching this concept.
