1. Introduction

The purpose of this study is to investigate the effect of the use of a mobile learning application on the learning outcomes of students in a mathematics course. The study was conducted in a secondary school in Turkey, where the use of mobile learning applications is not widespread. The research was carried out in two phases. In the first phase, the effectiveness of the application was evaluated by comparing the learning outcomes of students who used the application with those who did not. In the second phase, the application was used by a larger group of students, and the results were compared with the results of the first phase. The results of the study show that the use of the mobile learning application significantly improved the learning outcomes of students. This finding is important for the development of mobile learning applications and the use of technology in education. The study also has some limitations, such as the small sample size and the lack of control over other variables. Further research is needed to confirm the results of this study and to explore the use of mobile learning applications in other subjects and contexts.

2. Literature Review

Mobile learning applications have become a popular tool for education in recent years. These applications provide a variety of features, such as interactive content, personalized learning paths, and instant feedback. They also allow students to learn anytime and anywhere, which is a significant advantage over traditional classroom learning. However, there is still a need for more research on the effectiveness of mobile learning applications. Some studies have shown that mobile learning applications can improve learning outcomes, while others have found no significant difference. The results of the literature review suggest that the use of mobile learning applications can be effective, but it is important to consider the specific context and the design of the application. The current study aims to contribute to the understanding of the effectiveness of mobile learning applications by investigating the use of a specific application in a secondary school in Turkey.

3. Methodology

The study was conducted in a secondary school in Turkey, where the use of mobile learning applications is not widespread. The research was carried out in two phases. In the first phase, the effectiveness of the application was evaluated by comparing the learning outcomes of students who used the application with those who did not. In the second phase, the application was used by a larger group of students, and the results were compared with the results of the first phase. The data were collected through a series of tests and quizzes. The results were analyzed using statistical methods. The study was approved by the school's ethics committee. The participants were informed of the purpose of the study and gave their consent. The study was conducted in accordance with the ethical standards of research involving human subjects.

4. Results

The results of the study show that the use of the mobile learning application significantly improved the learning outcomes of students. This finding is important for the development of mobile learning applications and the use of technology in education. The study also has some limitations, such as the small sample size and the lack of control over other variables. Further research is needed to confirm the results of this study and to explore the use of mobile learning applications in other subjects and contexts.

5. Conclusion

The study concludes that the use of the mobile learning application significantly improved the learning outcomes of students. This finding is important for the development of mobile learning applications and the use of technology in education. The study also has some limitations, such as the small sample size and the lack of control over other variables. Further research is needed to confirm the results of this study and to explore the use of mobile learning applications in other subjects and contexts.
